What Manual Reporting Is Actually Costing You

The calculation most businesses have never done.

4 hours a week. 208 hours a year.

Rebuilding the exact same report.
Every single week.

A finance director we spoke to had been building the same management pack every month for 4 years. She calculated 9 working days per year. On one report.

→ **At £25/hour fully loaded: £5,200/year. On one report.**

You are always looking backwards.

The report takes a week to produce.
The problem happened last Tuesday.

A cash flow problem appeared on a Tuesday. It showed up in the management pack the following Friday. By then the short-term credit window had closed.

→ **A business on monthly reports is flying blind for 30 days at a time.**

Manual = errors. Always.

A formula right last month, wrong this month.
A number updated in one cell but not another.

An MD made a hiring decision based on margin figures that were miscalculated due to a broken VLOOKUP. The error was found 6 months later.

→ **One wrong number in a board pack can cost more than automating the whole process.**

The maths always works.

Build once: £1,500 to £4,000.
Ongoing cost: zero.

A manufacturing business automated their weekly operations report. Build cost: £2,800.
Time saved: 5 hours per week. Paid back in month 4.

→ **Payback in under 12 months. Every year after is pure saving.**
